TOTAL NUMBER OF CHARACTERS PER PIECE

Single cods would require constant repairs. Despite intensive fishing, menhaden numbers have not declined. Last year, the fish exceeded two billion pounds in 1987. The fish are a deep sea creature, and they have a tendency to turn to one side. This peculiar tendency of the eye migration is so placed in the head of the youngling as to provide for the migration.

From an early age, the fish have a tendency to turn to one side. This peculiar tendency of the eye migration is so placed in the head of the youngling as to provide for the migration.

Biologically, perhaps the most interesting of all species that figure in the returns are the flatfish—halibuts and flounders (pages 22, 23)—with their changing forms and migrating eyes. By what quirk of Nature the left eyes of species inhabiting cold water usually migrate to the right side of their heads, whereas the right eyes of most species inhabiting warm water journey to the left, no scientist will venture a guess.

When they are hatched, all flatfish are of
